

Our solar system contains quizlet

What Is an Exoplanet? The Short Answer: All of the planets in our solar system orbit around the Sun. Planets that orbit around other stars are called exoplanets. All of the planets ...

Solar system, assemblage consisting of the Sun and those bodies orbiting it: 8 planets with more than 400 known planetary satellites; many asteroids, some with their own satellites; comets and other icy bodies; and ...

Kuiper belt, flat ring of icy small bodies that revolve around the Sun beyond the orbit of the planet Neptune. It comprises hundreds of millions of objects whose orbits lie close to the plane of the solar system. The Kuiper belt ...

The Sun's gravity affects objects far beyond the orbits of the planets in our solar system. [Step 4]: Addressing the fourth question: "Does the sun's gravity pull all the planets towards it?" Yes, ...

A nebula is a giant cloud of dust and gas in space. Some nebulae (more than one nebula) come from the gas and dust thrown out by the explosion of a dying star, such as a supernova. Other nebulae are regions where new ...

In our Solar System, Saturn is the second-largest planet and is famous for its spectacular ring system, made of ice, rock, and dust. It is a gas giant just like Jupiter, meaning that Saturn is made up mostly of hydrogen and ...

Astronomers have spotted the birth of a new solar system for the very first time ever. Using the ALMA telescope, in which the European Southern Observatory (ESO) is a partner, and the ...

Solar system - Planets, Moons, Orbits: The eight planets can be divided into two distinct categories on the basis of their densities (mass per unit volume). The four inner, or terrestrial, planets--Mercury, Venus, Earth, and Mars--have rocky ...

The coldest planet in our solar system Neptune is dark, cold, and very windy. It's the last of the planets in our solar system. It's more than 30 times as far from the sun as Earth is. ...

Our solar system includes the Sun, planets, dwarf planets, moons, asteroids, comets, and other smaller objects. The Sun is approximately 149.6 million kilometers (93 million miles) from the ...

Extrasolar planet, any planetary body that is outside the solar system and that usually orbits a star other than the Sun. Extrasolar planets were first discovered in 1992. More than 5,000 are known, and almost 9,000 await ...
