

Where is voyager 1 right now

Voyager 1 is the farthest man-made object in the universe, having traveled over 14 billion miles from Earth since its launch by NASA on September 5, 1977. This spacecraft now resides in interstellar space, a region far beyond ...

Launched in 1977, Voyager 1 is humanity's most distant-made object, floating more than 15 billion miles away in interstellar space. Its main mission -- to explore the outer planets -- ended ...

VOYAGER 2, 10271 is a payload satellite owned by JPL (US) that was launched on Sat, 20 Aug 1977 UTC via a TITAN IIIIE launch vehicle from the Air Force Eastern Test Range (AFETR). Payload-class satellites include a ...

Voyager 1's sensors, which monitor cosmic rays, magnetic fields, and plasma density, started to send very abnormal patterns just before the change. "Something is affecting the spacecraft," ...

The Voyager missions are among the most groundbreaking and enduring space endeavors in history. Launched in 1977, Voyager 1 and Voyager 2 were tasked with exploring the outer planets, Jupiter ...

The planets today shows you where the planets are now as a live display - a free online orrery. In this solar system map you can see the planetary positions from 3000 BCE to 3000 CE, and also see when each planet is in retrograde.

As Voyager 1 pushes beyond Pluto, it reveals a shocking truth,the solar system is far vaster and more mysterious than we ever imagined. What we once thought was its edge, the Kuiper Belt, is just ...

Voyager 1 is sending back strange and terrifying data, and its ability to communicate with Earth seems to be faltering. The spacecraft's primary mission was to explore Jupiter and Saturn,...

Voyager 1, robotic U.S. interplanetary probe launched in 1977 that visited Jupiter and Saturn and was the first spacecraft to reach interstellar space. Voyager 1 swung by Jupiter on March 5, 1979, and then headed for Saturn, ...
